Responsible AI for Project and Contract Decisions

Digital Practice | Full episode transcript and learning guide

Episode overview

This PCMO episode examines responsible ai for project and contract decisions through professional practice, decisions, controls, behaviours, and evidence.

Learning objectives

- Recognise why the issue matters.
- Identify practical controls and behaviours.
- Evaluate contextual factors.
- Select actions for further application.

Full discussion transcript

1. AI may support analysis, drafting, classification, forecasting, and knowledge retrieval, but accountability remains human

AI may support analysis, drafting, classification, forecasting, and knowledge retrieval, but accountability remains human.

In practice, professionals should test information quality, clarify ownership and authority, consider risk and contractual context, communicate uncertainty honestly, and retain evidence of material decisions. The response should be proportionate to scale, complexity, urgency, stakeholder impact, and applicable obligations.

Constructive challenge asks what is known, what remains assumed, which evidence is verifiable, what could change the conclusion, who can decide, and how the outcome will be monitored.

2. Approved use cases, protected data, validation, explainability, and records are essential controls

Approved use cases, protected data, validation, explainability, and records are essential controls.

In practice, professionals should test information quality, clarify ownership and authority, consider risk and contractual context, communicate uncertainty honestly, and retain evidence of material decisions. The response should be proportionate to scale, complexity, urgency, stakeholder impact, and applicable obligations.

Constructive challenge asks what is known, what remains assumed, which evidence is verifiable, what could change the conclusion, who can decide, and how the outcome will be monitored.

3. Confidential, personal, privileged, or contract-restricted information must not enter unapproved systems

Confidential, personal, privileged, or contract-restricted information must not enter unapproved systems.

In practice, professionals should test information quality, clarify ownership and authority, consider risk and contractual context, communicate uncertainty honestly, and retain evidence of material decisions. The response should be proportionate to scale, complexity, urgency, stakeholder impact, and applicable obligations.

Constructive challenge asks what is known, what remains assumed, which evidence is verifiable, what could change the conclusion, who can decide, and how the outcome will be monitored.

4. High-impact outputs require qualified review, challenge, and escalation

High-impact outputs require qualified review, challenge, and escalation.

In practice, professionals should test information quality, clarify ownership and authority, consider risk and contractual context, communicate uncertainty honestly, and retain evidence of material decisions. The response should be proportionate to scale, complexity, urgency, stakeholder impact, and applicable obligations.

Constructive challenge asks what is known, what remains assumed, which evidence is verifiable, what could change the conclusion, who can decide, and how the outcome will be monitored.

Practical takeaways

- Define permitted and prohibited uses.
- Classify data before using AI.
- Validate outputs against reliable evidence.
- Record material AI-assisted decisions.
- Monitor bias, drift, error, and unintended consequences.

Reflection questions

1. Where does this issue appear in your environment?
2. Which control needs improvement?
3. What evidence would demonstrate progress?
4. Who should be involved?
5. What will you do in the next thirty days?
